SEO and Accessibility:

Contact.html:

The site is designed with a clear and organized structure to ensure it's easy to use and meets both SEO and accessibility standards. Semantic HTML elements like <header>, <main>, <footer>, <nav>, <article>, and <section> help search engines and screen readers understand the content and its layout. The headings are well-structured, with <h1> and <h2> tags creating a clear hierarchy, which improves readability for both users and search engines. For accessibility, the contact form uses labels (<label> tags) properly linked to their input fields with the for attribute, so assistive technologies like screen readers can describe each field accurately. Input types like email also add validation and make the form more user-friendly. Required fields ensure users complete the form before submission, reducing errors. Finally, the footer includes a clickable email link, making it simple for users to contact the site. Overall, the site is straightforward, user-friendly, and inclusive.
